DEEP LEARNING ON POINT CLOUD DATA

Agenda

- Why point cloud?
- Comparison of point cloud
- Point cloud generation by deep learning

Agenda

- **Why point cloud?**
- Comparison of point cloud
- Point cloud generation by deep learning

Point Clouds

- ◆ Simplest representation: **only points**, no connectivity
- ◆ Collection of (x,y,z) coordinates, possibly with normals
- ◆ Points with orientation are called **surfels**

Why Point Clouds?

- 1) Typically, that's the only thing that's available
- 2) Isolation: sometimes, easier to handle (esp. in hardware).

Fracturing Solids

Meshless Animation of Fracturing Solids
Pauly et al., SIGGRAPH '05

Fluids

Adaptively sampled particle fluids,
Adams et al. SIGGRAPH '07

Why Point Clouds?

- Typically, that's the only thing that's available
 Nearly all 3D scanning devices produce point clouds

Agenda

- Why point cloud?
- **Comparison of point cloud**
- Point cloud generation by deep learning

Point cloud as samples

- Point cloud can be thought as a representation of prob. distribution
- Compare point cloud is to compare underlying distributions

Motivating Question

Geometric theory of probability

Alternative Idea

Alternative Idea

Match mass from the distributions

Transportation Matrix

- Supply distribution p_0
- Demand distribution p_1

$$T \geq 0$$

$$T \mathbf{1} = p_0$$

$$T^\top \mathbf{1} = p_1$$

Earth Mover's Distance

$$\begin{aligned} \min_T \quad & \sum_{ij} T_{ij} d(x_i, x_j) && m \cdot d(x, y) \\ \text{s.t.} \quad & \sum_j T_{ij} = p_i && \text{Starts at } p \\ & \sum_i T_{ij} = q_j && \text{Ends at } q \\ & T \geq 0 && \text{Positive mass} \end{aligned}$$

Important Theorem

EMD is a metric when $d(x,y)$
satisfies the triangle inequality.

“The Earth Mover's Distance as a Metric for Image Retrieval”

Rubner, Tomasi, and Guibas; IJCV 40.2 (2000): 99—121.

Set comparison

Given two sets of points, measure their discrepancy

Set comparison

Given two sets of points, measure their discrepancy

Correspondence (I): optimal assignment

Given two sets of points, measure their discrepancy

a.k.a Earth Mover's distance (EMD)

$$d_{EMD}(S_1, S_2) = \min_{\phi: S_1 \rightarrow S_2} \sum_{x \in S_1} \|x - \phi(x)\|_2 \quad \text{where } \phi : S_1 \rightarrow S_2 \text{ is a bijection.}$$

Correspondence (II): closest point

Given two sets of points, measure their discrepancy

a.k.a Chamfer distance (CD)

$$d_{CD}(S_1, S_2) = \sum_{x \in S_1} \min_{y \in S_2} \|x - y\|_2^2 + \sum_{y \in S_2} \min_{x \in S_1} \|x - y\|_2^2$$

Required properties of distance metrics

Geometric requirement

Computational requirement

Required properties of distance metrics

Geometric requirement

- Reflects natural shape differences
- Induce a nice space for *shape interpolations*

Computational requirement

How distance metric affects learning?

dimension lifting

How distance metric affects learning?

A fundamental issue: inherent ambiguity in 2D-3D
dimension lifting

How distance metric affects learning?

A fundamental issue: inherent ambiguity in 2D-3D
dimension lifting

- By loss minimization, the network tends to predict a “**mean shape**” that **averages out** uncertainty

Distance metrics affect mean shapes

The mean shape carries characteristics of the distance metric

$$\bar{x} = \operatorname{argmin}_x \mathbb{E}_{s \sim \mathcal{S}} [d(x, s)]$$

continuous
hidden variable
(radius)

Input

EMD mean

Required properties of distance metrics

Geometric requirement

- Reflects natural shape differences
- Induce a nice space for shape interpolations

Computational requirement

- Defines a loss function that is numerically easy to optimize

Computational requirement of metrics

To be used as a loss function, the metric has to be

- **Differentiable** with respect to point locations
- **Efficient** to compute

Computational requirement of metrics

- **Differentiable** with respect to point location

Chamfer distance

$$d_{CD}(S_1, S_2) = \sum_{x \in S_1} \min_{y \in S_2} \|x - y\|_2^2 + \sum_{y \in S_2} \min_{x \in S_1} \|x - y\|_2^2$$

Earth Mover's distance

$$d_{EMD}(S_1, S_2) = \min_{\phi: S_1 \rightarrow S_2} \sum_{x \in S_1} \|x - \phi(x)\|_2 \quad \text{where } \phi: S_1 \rightarrow S_2 \text{ is a bijection.}$$

- Simple function of coordinates
- In general positions, the correspondence is unique
- **With infinitesimal movement, the correspondence does not change**

Conclusion: differentiable almost everywhere

Computational requirement of metrics

- **Differentiable** with respect to point location

- For many **algorithms** (sorting, shortest path, network flow, ...),
- an infinitesimal change to model parameters (almost) does not change solution structure,

leads to **differentiable a.e.!**

Co

ere

Computational requirement of metrics

- **Efficient** to compute

Chamfer distance: trivially parallelizable on CUDA

Earth Mover's distance (optimal assignment):

- We implement a **distributed** approximation algorithm on CUDA
- Based upon [Bertsekas, 1985], $(1 + \epsilon)$ -approximation
